## Footnotes

<sup>1</sup>Market Crash: when US stock markets are falling rapidly and the VIX is moving by a large amount. In general, crash protection strategies applied in the underlying fund start making money when the VIX future moves above 40 and then accelerates as the VIX continues to rise.

<sup>2</sup>Normal Market Conditions: when US stock markets are moving either up, sideways, or down for an extended period of time.

<sup>3</sup>The projected crash return is determined by a conservative estimate of return during a market crash using stress tests to shock implied volatility and market index prices by the Investment Manager of the underlying fund. Past performance is no indication of future results.
